A MEMO

Haptica

A context engine for agentic work.

Context management is the bottleneck for agentic work. AI agents lose memory between sessions, multi-agent workflows step over each other, and the humans working alongside the agents spend hours every week re-explaining what they're doing and why. Haptica is a context engine. Install it, log in, and it passively captures what you work on, builds a living wiki for every project you touch, updates as you work, and opens in any browser with a shareable link. Claude Code, Cursor, and Codex connect via MCP. No configuration, no prompts, no workflow changes.

The same capture layer that feeds context to a coding agent is the foundation for a faithful record of your digital life. We're not building that first because "remember everything" is a feature in search of a forcing function, and agentic workflows are that forcing function. Engineers today, everyone eventually.

TEAM

Paul Han

CO-FOUNDER

Paul Han first built a fusion generator in his basement and later went to the National Science Fair. At Yale (B.S. EE & Political Science), he was Political Union VP. After three years at Meta designing AI servers, he designed nuclear weapons at Livermore National Lab for two.

A builder who can sell and lead.

Jackie Oliver

CO-FOUNDER

Jackie Oliver first combined her obsession with markets and technology by automating TF2 skin trading arbitrage. She made enough to pay for every game purchase since. After UVA (B.A. Econ & Philosophy), she spent two years designing credit algorithms for modern banking rating systems.

A designer with an arbitrageur's nose.
