Haptica

Own Your Context.

Context is the bottleneck.

- Status updates, handoffs, and re-explanations eat hours every week.
- AI agents need context pasted in every session.
- Progress is invisible until you narrate it.

Haptica 1Context is the context engine for your work.

- Dynamic memory, built from your screen and terminal.
- A live wiki for all of your projects, which automatically updates in the background.
- Coordinate teams and multi-agent workflows: context is organized and easily accessible.

1Context

A credential broker and knowledge wiki built for collaborative work between humans and AI agents · Internal project page · Updated 2026-04-17

1Context is a self-hosted knowledge base and credential broker designed from the start for collaboration between humans and AI agents working on the same projects. It uses a stock BookStack installation as the underlying wiki engine and adds two parallel surfaces on top: a WikiWand-inspired editorial layer for human readers, and a token-efficient, discoverable surface for any AI agent that's handed a 1Context URL.

1Context · A wiki for humans and AI agents. Markdown source ↗

The thesis is that the most useful place to store evolving project context — design decisions, in-flight work, troubleshooting notes, infrastructure runbooks, capability tokens — is somewhere both humans and agents can read, write, and link to. URLs are the simplest unit of context handoff. 1Context invests heavily in making both audiences productive against the same URLs.

Overview

A 1Context deployment is a stock BookStack v26.03+ instance with the `bookstack-opcontext-module` theme installed. The theme is a static asset bundle (HTML + CSS + JS, no PHP) wired in via BookStack's standard theme module mechanism. It overlays its own UI on top of BookStack's existing chrome and uses BookStack's REST API for search and content retrieval. Capability tokens, oauth flows, and the AI chat backend live outside BookStack in a small companion service referred to as the broker; pages document but do not contain those secrets.

with haptica

Market size.

$20	$200	$1k	$5k
ENTRY	AGENTIC TIER	HEAVY	POWER
ChatGPT Plus Claude Pro Copilot Business	Cursor Ultra Claude Max ChatGPT Pro	Daily agentic users API overages	Parallel agents 24/7 runners

5M devs × $200 blended → $12B today.

Power users pull the average up — $5k / month is not rare.

Next: 100M knowledge workers at agentic prices. **$240B+ TAM by 2028.**

Business model

$40 *per seat, per month*

3-seat minimum.

Fits on a credit card.

- Dev-first. Initial motion: founder-to-founder outreach.
- Built for devs. Sold to teams.

CURRENT PILOT pandatron 30-day pilot, engineering team

Start with devs running agentic coding agents.

WEDGE

100–500

Engineers running Claude Code, Cursor, and Codex inside company teams.

BRIDGE

500–5,000

High-context knowledge workers

BEYOND

5,000+

Phone + mic: full-context capture across every device

Why now

01 AI is capable, and users are delegating real work to it.

02 Inference is cheap, deflationary, and feasible to serve passively at scale.

03 Context is the limiting factor.

How we win.

- Cross-agent by design. Claude, Cursor, ChatGPT, all of it.
- One command to install. MCP-native, CLI and API.
- Context compounds instantly.

Why incumbents can't follow.

- ChatGPT memory lives in ChatGPT. Claude's lives in Claude. Cursor's in Cursor.
- Every incumbent's business model rewards lock-in. Ours rewards portability.
- We're the layer that shares context.

Haptica Team

Paul Han
Co-Founder

Former datacenter hardware engineer at Meta. Nuclear weapons programs at Lawrence Livermore National Laboratory. Yale, electrical engineering and political science.

Jackie Oliver
Co-Founder

Former data engineer building production ML scoring models and pipelines for fintech credit-risk products. UVA, economics and philosophy. Built TF2 arbitrage bots as a teenager.
